Summary of testing:

- This standard updated test report is based on the previous EN 60950-1:2006 + A11:2009 + A1:2010 + A12:2011 + A2:2013 test report issued by TÜV Rheinland, details as below:
 - test report number: 10052799 001
- The differences between EN 60950-1 and EN 62368-1 were considered. However, no foreseeable hazards and no further tests were conducted since the product is building-in type, supplied by secondary voltage with low power consumption.
- The decision rule of conformity of this test report is following the requirements of the requested standard in this test report, and agreed among testing laboratory and manufacturer (applicant) to exclude the consideration of Measurement Uncertainty.

--------	--------------------	-----------------	---------

Supplementary information:

An Arcing PIS requires a minimum of 50 V (peak) a.c. or d.c. An Arcing PIS is established when the product of the open circuit voltage (V_p) and normal operating condition rms current (I_{rms}) is greater than 15.

6.2.3.2	Table: Determination of Potential Ignition Sources (Resistive PIS)					N/A

Supplementary information:

A combination of voltmeter, VA and ammeter IA may be used instead of a wattmeter. If a separate voltmeter and ammeter are used, the product of (VA x IA) is used to determine Resistive PIS classification.

A Resistive PIS: (a) dissipates more than 15 W, measured after 30 s of normal operation, or (b) under single fault conditions has either a power exceeding 100 W measured immediately after the introduction of the fault if electronic circuits, regulators or PTC devices are used, or has an available power exceeding 15 W measured 30 s after introduction of the fault.
